#### Abstract

In this paper, we introduce a notion of extended Cone $\mathrm{S}_{\mathrm{b}}$-metric space and prove some fixed point results with various types of contractive conditions. Our results enlarge many results in the literature.

Keywords: cone metric space, extended $S_{b}$ - metric space, fixed point

## 1. Introduction and Preliminaries

In 2007, Huang and Zhang [1] introduced the idea of cone metric space, which is a generalization of metric space by replacing the real numbers by ordering Banach space. Consequently, several originators consider the development of cone metric space for mappings that satisfying different contractive conditions [2-14].

The concept of S - metric space was initiated by Sedghi et. al. [15] in 2012, which is distinct from other spaces and established some fixed point results in S - metric space. Many authors enlarged the idea of S - metric space and obtained some fixed point theorems in various contractive conditions [16-22].

A notion of $\mathrm{S}_{\mathrm{b}}$-metric space was initiated by Souayah and Mlaiki [23] in 2016. Dhamodharan and krishnakumar [24] expanded the idea of S - metric space to cone S-metric space in 2017 and established various fixed point results. Several authors developed the idea of cone S-metric space in fixed point theory. [1,23-33].

The concept of cone $\mathrm{S}_{\mathrm{b}}$-metric space was initiated by Singh and Singh [34] in 2018 and obtained some fixed point results. Nabil Mlaiki [31] introduced the concept of extended $\mathrm{S}_{\mathrm{b}}$-metric space and proved some fixed point theorems for mappings satisfying the different contractive conditions [34,35,36,37].

In this paper, we introduce the notion of extended cone $\mathrm{S}_{\mathrm{b}}$-metric space which is a generalization of cone $\mathrm{S}_{\mathrm{b}}$ - metric space and prove some fixed point theorems in extended cone $\mathrm{S}_{\mathrm{b}}$ - metric space.
Definition 1.1. [15] Let $X$ be a nonempty set and a function $\Gamma: \mathrm{X}^{3} \rightarrow[0, \infty)$ satisfies the following conditions.

1. $\Gamma\left(v_{1}, v_{2}, v_{3}\right) \geq 0$.
2. $\Gamma\left(v_{1}, v_{2}, v_{3}\right)=0$ if and only if $v_{1}=v=v_{3}$,
3. $\Gamma\left(v_{1}, v_{2}, v_{3}\right) \leq \Gamma\left(v_{1}, v_{1}, t\right)+\Gamma\left(v_{2}, v_{2}, t\right)+\Gamma\left(v_{3}, v_{3}, t\right)$ for all $v_{1}, v_{2}, v_{3}, t \in \mathrm{X}$.
Then $\Gamma$ is called S- metric on X and the pair ( $\mathrm{X}, \Gamma$ ) is called an S-metric space.
Example 1.1. [15] Let $X$ be a non-empty set and the metric don X. Then

$$
\Gamma\left(v_{l}, v_{2}, v_{3}\right)=\mathrm{d}\left(v_{l}, v_{3}\right)+\mathrm{d}\left(v_{2}, v_{3}\right)
$$

is an S -metric on X .
Definition 1.2. [23] Let $X$ be a nonempty set and let $b \geq 1$ be real number. Define a function $\Gamma_{b}: \mathrm{X}_{3} \rightarrow[0, \infty)$ is called an $\mathrm{S}_{\mathrm{b}}$-metric if it is satisfies the following conditions.

1. $\boldsymbol{\Gamma}_{\boldsymbol{b}}\left(\mathrm{v}_{1}, \mathrm{v}_{2}, \mathrm{v}_{3}\right)=0$ iff $\mathrm{v}_{1}=\mathrm{v}_{2}=\mathrm{v}_{3}$,
2. $\boldsymbol{\Gamma}_{\boldsymbol{b}}\left(\mathrm{v}_{1}, \mathrm{v}_{1}, \mathrm{v}_{2}\right)=\Gamma_{\mathrm{b}}\left(\mathrm{v}_{2}, \mathrm{v}_{2}, \mathrm{v}_{1}\right)$ for all $\mathrm{v}_{1}, \mathrm{v}_{2} \in \mathrm{X}$.
3. $\Gamma_{b}\left(v_{1}, v_{2}, v_{3}\right) \leq b\left(\Gamma_{b}\left(v_{1}, v_{1}, t\right)+\Gamma_{b}\left(v_{2}, v_{2}, t\right)+\right.$ $\left.\Gamma_{b}\left(v_{3}, v_{3}, t\right)\right)$

Then the pair ( $\mathrm{X}, \Gamma_{b}$ ) is called $\mathrm{S}_{\mathrm{b}}$-metric space.
Definition 1.3. [31] Let $X$ be a nonempty set and $\zeta: \mathrm{X}^{3} \rightarrow[1, \infty)$. A function $\Gamma_{\zeta}: \mathrm{X}^{3} \rightarrow[0, \infty)$ satisfies the following conditions.

(ii) $\Gamma_{\zeta}\left(v_{1}, v_{2}, v_{3}\right) \leq \zeta\left(v_{1}, v_{2}, v_{3}\right)\left(\Gamma_{\zeta}\left(v_{1}, v_{1}, t\right)+\Gamma_{\zeta}\left(v_{2}, v_{2}, t\right)+\right.$ $\left.\Gamma_{\zeta}\left(v_{3}, v_{3}, t\right)\right)$

Then the pair $\left(\mathrm{X}, \Gamma_{\zeta}\right)$ is called extended $\mathrm{S}_{\mathrm{b}}-$ metric space.
Definition 1.4. [1] Let $E$ be the real Banach space and $M$ be a subset of E is called a cone if it is satisfies the following conditions.

1. M is closed and non-empty $\mathrm{M} \neq 0$,
2. $\mathrm{p} v_{1}+\mathrm{q} v_{2} \in \mathrm{M}$ for all $v_{1}, v_{2} \in \mathrm{M}$ and non-negative real numbers p , q.
3. $\mathrm{M} \cap(-\mathrm{M})=0$.

For a given cone $\mathrm{M} \subset \mathrm{E}$, define a partial ordering $\leq$ on E with respect to M by $v_{1} \leq v_{2}$ if and only if
$v_{2}-v_{1} \in \mathrm{M}$, while $v_{1} \leq v_{2}$ will stand for $v_{2}-v_{1} \in$ int M (interior of M ).

The cone M is called normal if there is a constant $\mathrm{K}>0$ such that for all $v_{1}, v_{2} \in \mathrm{E}, 0 \leq v_{1} \leq v_{2}$ implies $\left\|v_{1}\right\| \leq \mathrm{K}\left\|v_{2}\right\|$.

Then K is called the normal constant of M .
The cone $M$ is called regular if every increasing sequence which is bounded from above is convergent.
Example 1.2. [1] Let E be the real vector space and $\mathrm{K}>1$ then,

$$
E=\left\{p v_{1}+q: p, q \in R ; v_{1} \in\left[1-\frac{1}{\mathrm{~K}}, 1\right]\right\}
$$

with supermom norm and the cone $M=\left\{p v_{1}+q \in E\right.$ : $p \geq 0, q \geq 0\}$ in $E$. The cone $M$ is regular and normal.
Definition 1.5. [1] Let X be a non-empty set and $\Gamma$ : $\mathrm{X} \times \mathrm{X}$ $\rightarrow$ E satisfies the following conditions.

1. $0 \leq \Gamma\left(v_{1}, v_{2}\right)$ for all $v_{1}, v_{2} \in \mathrm{X}$ and $\Gamma\left(v_{1}, v_{2}\right)=0$ if and only if $v_{1}=v_{2}$.
2. $\Gamma\left(v_{1}, v_{2}\right)=\Gamma\left(v_{2}, v_{1}\right)$ for all $v_{1}, v_{2} \in \mathrm{X}$.
3. $\Gamma\left(v_{1}, v_{2}\right) \leq \Gamma\left(v_{1}, v_{3}\right)+\Gamma\left(v_{3}, v_{2}\right)$
for all $v_{1}, v_{2}, v_{3} \in \mathrm{X}$. Then $\Gamma$ is called a cone metric on X and $(\mathrm{X}, \Gamma)$ is called a cone metric space.
Definition 1.6. [24] Let $M$ be a cone in $E$ (real Banach space) with int $M \neq 0$ and $\leq$ is a partial ordering with respect to M . Let X be a non-empty set and define a function $\Gamma: \mathrm{X}^{3} \rightarrow \mathrm{E}$, if $\Gamma$ satisfies all the conditions,
4. $\Gamma\left(v_{1}, v_{2}, v_{3}\right) \geq 0$
5. $\Gamma\left(v_{1}, v_{2}, v_{3}\right)=0$ if and only if $v_{1}=v_{2}=v_{3}$
6. $\Gamma\left(v_{1}, v_{2}, v_{3}\right) \leq \Gamma\left(v_{1}, v_{1}, \mathrm{t}\right)+\Gamma\left(v_{2}, v_{2}, \mathrm{t}\right)+\Gamma\left(v_{3}, v_{3}, t\right)$ for all $v_{1}, v_{2}, v_{3}, t \in \mathrm{X}$.
Then $\Gamma$ is called a cone S-metric on X and $(\mathrm{X}, \Gamma)$ is called a cone S-metric space.
Example 1.3. [24] Let $\mathrm{E}=\mathrm{R}^{2}, \mathrm{M}=\left\{\left(v_{1}, v_{2}\right) \in \mathrm{R}^{2}: v_{1} \geq 0\right.$, $\left.v_{2} \geq 0\right\} \subset \mathrm{R}^{2}, \mathrm{X}=\mathrm{R}$ and $\mathrm{d}: \mathrm{X} \times \mathrm{X} \times \mathrm{X} \rightarrow \mathrm{E}$ be the metric on X then $\Gamma: \mathrm{X}^{3} \rightarrow \mathrm{E}$ defined by

$$
\begin{aligned}
& \Gamma\left(v_{l}, v_{2}, v_{3}\right)= \\
& \left(\partial\left(v_{l}, v_{3}\right)+\partial\left(v_{2}, v_{3}\right), \alpha\left(\partial\left(v_{l}, v_{3}\right)+\partial\left(v_{2}, v_{3}\right)\right)\right.
\end{aligned}
$$

is a cone S-metric on X where $\alpha>0$ is a constant.
Definition 1.7. [34] Let $X$ be a nonempty set and $M$ be a cone in E (real Banach space) and define $\Gamma_{b}: \mathrm{X}^{3} \rightarrow \mathrm{E}$ is satisfies the following conditions

1. $\Gamma_{b}\left(v_{1}, v_{2}, v_{3}\right) \geq 0$.
2. $\Gamma_{b}\left(v_{1}, v_{2}, v_{3}\right)=0$ if and only if $v_{1}=v_{2}=v_{3}$.
3. $\Gamma_{b}\left(v_{1}, v_{2}, v_{3}\right) \leq \mathrm{r}\left[\Gamma_{b}\left(v_{1}, v_{1}, t\right)+\Gamma_{b}\left(v_{2}, v_{2}, t\right)+\Gamma_{b}\left(v_{3}, v_{3}, t\right)\right]$
for all $v_{1}, v_{2}, v_{3}, t \in \mathrm{X}$, where $\mathrm{r} \geq 1$ is a constant then $\Gamma_{b}$ is called a cone $\mathrm{S}_{\mathrm{b}}$ - metric on X and ( $\mathrm{X}, \Gamma_{b}$ ) is called an cone $\mathrm{S}_{\mathrm{b}}$-metric space.

## 2. Main Result

In this section, we introduce an extended cone $\mathrm{S}_{\mathrm{b}}$ - metric space and prove some fixed point results in extended cone $\mathrm{S}_{\mathrm{b}}$-metric space.
Definition 2.1. Let X be a non-empty set and $\zeta: \mathrm{X}^{3} \rightarrow$ $[1, \infty)$ be a function. If $\Gamma_{\zeta}: \mathrm{X}^{3} \rightarrow \mathrm{E}$ (Real Banach Space) satisfies the following conditions.

1. $\Gamma_{\zeta}\left(v_{1}, v_{2}, v_{3}\right) \geq 0$.
2. $\Gamma_{\zeta}\left(v_{1}, v_{2}, v_{3}\right)=0$ if and only if $v_{1}=v_{2}=v_{3}$.
3. $\Gamma_{\zeta}\left(v_{1}, v_{2}, v_{3}\right) \leq \zeta\left(v_{1}, v_{2}, v_{3}\right)\left(\Gamma_{\zeta}\left(v_{1}, v_{1}, t\right)+\right.$ $\left.\Gamma_{\zeta}\left(v_{2}, v_{2}, t\right)+\Gamma_{\zeta}\left(v_{3}, v_{3}, t\right)\right)$
for all $v_{1}, v_{2}, v_{3}, t \in \mathrm{X}$.
Then ( $\mathrm{X}, \Gamma_{\zeta}$ ) is called an extended cone $\mathrm{S}_{\mathrm{b}}$ - metric space.
Remark 2.1. If $\zeta\left(v_{1}, v_{2}, v_{3}\right)=1$, then the extended cone $\mathrm{S}_{\mathrm{b}}{ }^{-}$ metric space reduces to a cone S - metric space.
Remark 2.2. If $\zeta\left(v_{1}, v_{2}, v_{3}\right)=\mathrm{b} \geq 1$ then the extended cone $\mathrm{S}_{\mathrm{b}}$-metric space is said to be cone $\mathrm{S}_{\mathrm{b}}$-metric space.
Lemma 2.1. Let ( $\mathrm{X}, \Gamma_{\zeta}$ ) be an extended cone $\mathrm{S}_{\mathrm{b} \text {-metric }}$ space. Then we have $\Gamma_{\zeta}\left(v_{1}, v_{1}, v_{2}\right)=\Gamma_{\zeta}\left(v_{2}, v_{2}, v_{1}\right)$.
Definition 2.2. Let ( $\mathrm{X}, \Gamma_{\zeta}$ ) be an extended cone $\mathrm{S}_{\mathrm{b}}$ - metric space and M be a normal cone.
1) A sequence $\left\{v_{n}\right\} \in X$ converges to $w$ if and only if $\mathrm{w} \in \mathrm{X}$ such that $\Gamma_{\zeta}\left(v_{n}, v_{n}, \mathrm{w}\right) \rightarrow 0$ as $\mathrm{n} \rightarrow \infty$. we can write this $\lim _{\mathrm{n} \rightarrow \infty} v_{n}=\mathrm{w}$.
2) A sequence $\left\{v_{n}\right\}$ is said to be Cauchy sequence if and only if $\Gamma_{\zeta}\left(v_{n}, v_{n}, v_{m}\right) \rightarrow 0$ as $\mathrm{n}, \mathrm{m} \rightarrow \infty$.
3) If every Cauchy sequence $\left\{v_{n}\right\}$ converges to $w \in X$, then ( $\mathrm{X}, \Gamma$ ) is said to be a complete extended cone $\mathrm{S}_{\mathrm{b}}$ - metric space.
Example 2.1. Let $\mathrm{E}=\mathrm{R}^{2}$ and M be a cone in E . Let $\mathrm{X}=$ $[0, \infty)$ define a function $\Gamma_{\zeta}: \mathrm{X}^{3} \rightarrow \mathrm{E}$ such that

$$
\begin{aligned}
& \Gamma_{\zeta}\left(v_{1}, v_{2}, v_{3}\right) \\
& =\left\{\left[\left|v_{1}-v_{3}\right|+\left|v_{2}-v_{3}\right|\right]^{2}, \alpha\left[\left|v_{1}-v_{3}\right|+\left|v_{2}-v_{3}\right|\right]^{2}\right\}
\end{aligned}
$$

where $\alpha>0$ is a constant and a function $\zeta: \mathrm{X}^{3} \rightarrow[1, \infty)$ by $\zeta\left(v_{1}, v_{2}, v_{3}\right)=\max \left\{v_{1}, v_{2}\right\}+v_{3}+1$ then $\left(\mathrm{X}, \Gamma_{\zeta}\right)$ is a complete extended cone $S_{b}$ - metric space
Theorem 2.1. Let ( $\mathrm{X}, \Gamma_{\zeta}$ ) be a complete extended cone $\mathrm{S}_{\mathrm{b}}$ - metric space and T be a self-mapping on X satisfying the following condition

$$
\begin{align*}
& \Gamma_{\zeta}\left(\mathrm{T} v_{1}, \mathrm{~T} v_{2}, \mathrm{~T} v_{3}\right) \\
& \leq\left\{\begin{array}{l}
\mathrm{c}_{1} \Gamma_{\zeta}\left(v_{1}, v_{2}, v_{3}\right)+\mathrm{c}_{2} \Gamma_{\zeta}\left(v_{1}, \mathrm{~T} v_{1}, \mathrm{~T} v_{1}\right) \\
+\mathrm{c}_{3} \Gamma_{\zeta}\left(v_{2}, \mathrm{~T} v_{2}, \mathrm{~T} v_{2}\right)+\mathrm{c}_{4} \Gamma_{\zeta}\left(v_{3}, \mathrm{~T} v_{3}, \mathrm{~T} v_{3}\right)
\end{array}\right\} \tag{1}
\end{align*}
$$

for all $v_{1}, v_{2}, v_{3} \in \mathrm{X}$ where $0 \leq \mathrm{c}_{1}+\mathrm{c}_{2}+\mathrm{c}_{3}+\mathrm{c}_{4}<1$ and $\lim _{\mathrm{n} \rightarrow \infty} \zeta\left(\mathrm{T}^{\mathrm{n}} \mathrm{x}, \mathrm{T}^{\mathrm{n}} \mathrm{x}, \mathrm{T}^{\mathrm{m}} \mathrm{x}\right)<\frac{1}{2 \mathrm{~b}}$ for $0 \leq \mathrm{b}<\frac{1}{2}$, then T has a unique fixed point.
Proof. Let $v_{0} \in \mathrm{X}$, define a sequence $\left\{v_{n}\right\}$ by $\mathrm{T}^{\mathrm{n}} v_{0}=v_{n}$ from (1)

$$
\begin{aligned}
& \Gamma_{\zeta}\left(v_{n}, v_{n+1}, v_{n+1}\right) \\
& =\Gamma_{\zeta}\left(\mathrm{T} v_{n-1}, \mathrm{~T} v_{n}, \mathrm{~T} v_{n}\right) \\
& \leq\left\{\begin{array}{l}
\mathrm{c}_{1} \Gamma_{\zeta}\left(v_{n-1}, v_{n}, v_{n}\right)+\mathrm{c}_{2} \Gamma_{\zeta}\left(v_{n-1}, \mathrm{~T} v_{n-1}, \mathrm{~T} v_{n-1}\right) \\
+\mathrm{c}_{3} \Gamma_{\zeta}\left(v_{n}, \mathrm{~T} v_{\mathrm{n}}, \mathrm{~T} v_{\mathrm{n}}\right)+\mathrm{c}_{4} \Gamma_{\zeta}\left(v_{n}, \mathrm{~T} v_{n}, \mathrm{~T} v_{n}\right)
\end{array}\right\} \\
& \leq\left\{\begin{array}{l}
\mathrm{c}_{1} \Gamma_{\zeta}\left(v_{n-1}, v_{n}, v_{n}\right)+\mathrm{c}_{2} \Gamma_{\zeta}\left(v_{n-1}, v_{n}, v_{n}\right) \\
+\mathrm{c}_{3} \Gamma_{\zeta}\left(v_{n}, v_{n+1}, v_{n+1}\right)+\mathrm{c}_{4} \Gamma_{\zeta}\left(v_{n}, v_{n+1}, v_{n+1}\right)
\end{array}\right\} \\
& \leq\left(\mathrm{c}_{1}+\mathrm{c}_{2}\right) \Gamma_{\zeta}\left(v_{n-1}, v_{n}, v_{n}\right)+\left(\mathrm{c}_{3}+\mathrm{c}_{4}\right) \Gamma_{\zeta}\left(v_{n}, v_{n+1}, v_{n+1}\right) \\
& \Gamma_{\zeta}\left(v_{n}, v_{n+1}, v_{n+1}\right)\left(1-c_{3}-c_{4}\right) \leq\left(c_{1}+c_{2}\right) \Gamma_{\zeta}\left(v_{n-1}, v_{n}, v_{n}\right) \\
& \quad \Gamma_{\zeta}\left(v_{n}, v_{n+1}, v_{n+1}\right) \leq\left(\frac{\mathrm{c}_{1}+\mathrm{c}_{2}}{1-\mathrm{c}_{3}-\mathrm{c}_{4}}\right) \Gamma_{\zeta}\left(v_{n-1}, v_{n}, v_{n}\right)
\end{aligned}
$$

$$
\Gamma_{\zeta}\left(v_{n}, v_{n+1}, v_{n+1}\right) \leq b \Gamma_{\zeta}\left(v_{n-1}, v_{n}, v_{n}\right)
$$

where $\mathrm{b}=\frac{\left(c_{1}+c_{2}\right)}{\left(1-c_{3}-c_{4}\right)}, 0 \leq \mathrm{b}<1 / 2$ continue this process to obtain

$$
\Gamma_{\zeta}\left(v_{n}, v_{n+1}, v_{n+1}\right) \leq b^{n} \Gamma_{\zeta}\left(v_{0}, v_{1}, v_{1}\right)
$$

for all $\mathrm{m}, \mathrm{n} \in \mathrm{N}$ and $\mathrm{n}<\mathrm{m}$. Hence by triangle inequality

$$
\begin{aligned}
& \Gamma_{\zeta}\left(v_{n,}, v_{n}, v_{m}\right) \\
& \leq \zeta\left(v_{n}, v_{n}, v_{m}\right)(2 b)^{n} \Gamma_{\zeta}\left(v_{0}, v_{0}, v_{1}\right) \\
& +\zeta\left(v_{n}, v_{n}, v_{m}\right) \zeta\left(v_{n+1}, v_{n+1}, v_{m}\right)(2 b)^{n+1} \Gamma_{\zeta}\left(v_{0}, v_{0}, v_{1}\right) \\
& +\cdots . \\
& +\zeta\left(v_{n,} v_{n}, v_{m}\right) \cdots \zeta\left(v_{m-1}, v_{m-1}, v_{m}\right)(2 k)^{m-1} \Gamma_{\zeta}\left(v_{0}, v_{0}, v_{1}\right) \\
& \leq \Gamma_{\zeta}\left(v_{0}, v_{0}, v_{1}\right) \\
& {\left[\zeta\left(v_{1}, v_{1}, v_{m}\right) \zeta\left(v_{2}, v_{2}, v_{m}\right) \cdots\right.} \\
& \zeta\left(v_{n-1}, v_{n-1}, v_{m}\right) \zeta\left(v_{n}, v_{n,}, v_{m}\right)(2 b)^{n} \\
& +\zeta\left(v_{1}, v_{1}, v_{m}\right) \zeta\left(v_{2}, v_{2}, v_{m}\right) \cdots \\
& \zeta\left(v_{n,}, v_{n}, v_{m}\right) \zeta\left(v_{n+1}, v_{n+1}, v_{m}\right)(2 b)^{n+1} \\
& +\cdots \cdots+\zeta\left(v_{1}, v_{1}, v_{m}\right) \zeta\left(v_{2}, v_{2}, v_{m}\right) \cdots \cdot \\
& \left.\zeta\left(v_{m-2,}, v_{m-2}, v_{m}\right) \zeta\left(v_{m-1}, v_{m-1}, v_{m}\right)(2 b)^{m-1}\right]
\end{aligned}
$$

by the hypothesis of the theorem

$$
\lim _{\mathrm{n} \rightarrow \infty} \zeta\left(v_{n}, v_{n}, v_{m}\right)(2 \mathrm{~b})<1
$$

by Ratio test series

$$
\sum_{\mathrm{n}=1}^{\infty}(2 \mathrm{~b})^{\mathrm{n}} \prod_{\mathrm{i}=1}^{\mathrm{n}} \zeta\left(v_{i}, v_{i}, v_{m}\right)
$$

converges.
Let $\mathrm{A}=\sum_{\mathrm{n}=1}^{\infty}(2 \mathrm{~b})^{\mathrm{n}} \prod_{\mathrm{i}=1}^{\mathrm{n}} \zeta\left(v_{i}, v_{i}, v_{m}\right)$ and An $=\sum_{\mathrm{j}=1}^{\mathrm{n}}(2 \mathrm{~b})^{\mathrm{j}} \prod_{\mathrm{i}=1}^{\mathrm{j}} \zeta\left(v_{i}, v_{i}, v_{m}\right)$, for $\mathrm{m}>\mathrm{n}$, we have

$$
\Gamma_{\zeta}\left(v_{n}, v_{n}, v_{m}\right) \leq \Gamma_{\zeta}\left(v_{0}, v_{0}, v_{1}\right)\left[A_{m-1}-A\right]
$$

Taking limit as $n, m \rightarrow \infty$, the sequence $\left\{v_{n}\right\}$ is a Cauchy sequence. Since X is complete. $\left\{v_{n}\right\}$ converges to $v \in X$.

By (1) and the triangle inequality,

$$
\begin{aligned}
& \Gamma_{\zeta}(v, v, T v) \\
& \leq \zeta(v, v, T v)\left[2 \Gamma_{\zeta}\left(v, v, v_{n}\right)+\Gamma_{\zeta}\left(T v, T v, v_{n}\right)\right] \\
& \leq \zeta(v, v, T v)\left[2 \Gamma_{\zeta}\left(v, v, v_{n}\right)+k \Gamma_{\zeta}\left(v, v, v_{n-1}\right)\right]
\end{aligned}
$$

Taking limit as $\mathrm{n} \rightarrow \infty$,

$$
\Gamma_{\zeta}(v, v, T v)=0
$$

that implies $\mathrm{T} v=v$. Hence $v$ is a fixed point of T. To prove that uniqueness, assume that there exists $v \neq w \in \mathrm{X}$ such that $\mathrm{T} v=v$ and $\mathrm{T} w=w$.

Thus,

$$
\begin{aligned}
& \Gamma_{\zeta}(w, v, v)=\Gamma_{\zeta}(T w, T v, T v) \\
& \leq c_{1} \Gamma_{\zeta}(w, v, v)+c_{2} \Gamma_{\zeta}(w, T w, T w) \\
& \quad+\left(c_{3}+c_{4}\right) \Gamma_{\zeta}(v, T v, T v) \\
& \leq b \Gamma_{\zeta}(w, v, v)<\Gamma_{\zeta}(w, v, v)
\end{aligned}
$$

which is a contradiction. Therefore, T has a unique fixed point.

If $c_{1}=c$ and $c_{2}=c_{3}=c_{4}=0$ in Theorem 2.1, then the following corollary is obtained.
Corollary 2.1. Let ( $\mathrm{X}, \Gamma_{\zeta}$ ) be a complete extended cone $\mathrm{S}_{\mathrm{b}}$ - metric space and T be a self-mapping on X satisfying the following condition

$$
\begin{equation*}
\Gamma_{\zeta}\left(T v_{1}, T v_{2}, T v_{3}\right) \leq c \Gamma_{\zeta}\left(v_{1}, v_{2}, v_{3}\right) \tag{2}
\end{equation*}
$$

For all $v_{1}, v_{2}, v_{3} \in \mathrm{X}$ where $0 \leq \mathrm{c}<1 / 2$ and $\lim _{\mathrm{n} \rightarrow \infty} \zeta\left(\mathrm{T}^{\mathrm{n}} \mathrm{x}, \mathrm{T}^{\mathrm{n}} \mathrm{x}, \mathrm{T}^{\mathrm{m}} \mathrm{x}\right)<1 / 2 \mathrm{c}$, then T has a unique fixed point.

If $\mathrm{c}_{1}=0$ and $\mathrm{c}_{2}=\mathrm{c}_{3}=\mathrm{c}_{4}=\mathrm{c}$ in the Theorem 2.1, then the following corollary is obtained.
Corollary 2.2. Let ( $\mathrm{X}, \Gamma_{\zeta}$ ) be a complete extended cone $\mathrm{S}_{\mathrm{b}}$-metric space and $\mathrm{T}: \mathrm{X} \rightarrow \mathrm{X}$ satisfy the following conditions

$$
\begin{aligned}
& \Gamma_{\zeta}\left(T v_{1}, T v_{2}, T v_{3}\right) \\
& \leq c\left(\Gamma_{\zeta}\left(v_{1}, T v_{1}, T v_{1}\right)+\Gamma_{\zeta}\left(v_{2} T v_{2}, T v_{2}\right)+\Gamma_{\zeta}\left(v_{3}, T v_{3}, T v_{3}\right)\right)
\end{aligned}
$$

for all $v_{1}, \quad v_{2}, \quad v_{3} \in \mathrm{X}$ where $0 \leq \mathrm{c}<1 / 2$ and $\lim _{\mathrm{n} \rightarrow \infty} \zeta\left(\mathrm{T}^{\mathrm{n}} \mathrm{x}, \mathrm{T}^{\mathrm{n}} \mathrm{x}, \mathrm{T}^{\mathrm{m}} \mathrm{x}\right)<1 / 2 \mathrm{c}$, then T has a unique fixed point.
Example 2.2. Let $\mathrm{E}=\mathrm{R}^{2}$ and M be a cone in E . Let $\mathrm{X}=$ $[0, \infty)$ define a function $\Gamma_{\zeta}: \mathrm{X}^{3} \rightarrow \mathrm{E}$ such that

$$
\begin{aligned}
& \Gamma_{\zeta}\left(T v_{1}, T v_{2}, T v_{3}\right) \\
& =\left\{\left(\left|v_{1}-v_{3}\right|+\left|v_{2}-v_{3}\right|^{2}, \alpha\left|v_{1}-v_{3}\right|+\left|v_{2}-v_{3}\right|^{2}\right)\right\}
\end{aligned}
$$

where $\alpha>0$, is a constant and a function $\zeta: \mathrm{X}^{3} \rightarrow[1, \infty)$ defined by

$$
\zeta\left(v_{1}, v_{2}, v_{3}\right)=\max \left\{v_{1}, v_{2}\right\}+v_{3}+1
$$

Then ( $\mathrm{X}, \Gamma_{\zeta}$ ) is a complete extended cone $\mathrm{S}_{\mathrm{b}}$-metric space. Consider the mapping $\mathrm{T}: \mathrm{X} \rightarrow \mathrm{X}$ defined by

$$
\mathrm{T} v_{1}=\frac{v_{1}}{2}
$$

Then

$$
\begin{aligned}
& \Gamma_{\zeta}\left(\mathrm{T} v_{1}, \mathrm{~T} v_{2}, \mathrm{~T} v_{3}\right) \\
& =\left\{\begin{array}{l}
\left(\left|\frac{v_{1}}{2}-\frac{v_{3}}{2}\right|+\left|\frac{v_{2}}{2}-\frac{v_{3}}{2}\right|\right)^{2}, \\
\alpha\left(\left|\frac{v_{1}}{2}-\frac{v_{3}}{2}\right|+\left|\frac{v_{2}}{2}-\frac{v_{3}}{2}\right|\right)^{2}
\end{array}\right\} \\
& \leq \frac{1}{4} \Gamma_{\zeta}\left(v_{1}, v_{2}, v_{3}\right)
\end{aligned}
$$

where $\mathrm{c} \in\left[0, \frac{1}{2}\right.$ ), thus T satisfies all the conditions of Corollary 2.1 and hence T has a unique fixed point.

## 3. Conclusion

Fixed point theory plays an essential role in all branches of Mathematics. In this paper, we introduced an extended cone $\mathrm{S}_{\mathrm{b}}$-metric space and proved some fixed results in various contractive conditions. Our results extends several results in existing literature.

## Acknowledgements

The authors would like to express their thanks to the editors and reviewers for valuable advice in helping to improve the manuscript.

## Conflict of Interest

There is no conflict of interest.
